//lab_host="Deliang (GeneHog, Invitrogen, Inc.)"
//note="Vector: Bluescript SK plus; Site_1: EcoRI; Site_2:
Xhoi; The library was constructed by R Haywood. cDNAs were
synthesized from ganetocyte poly(A)+ RNA by oligo d(T)
priming, size-selected and directionally cloned into the
EcoRi (5'end) to Xhoi (3'end) sites of the Uni-ZAP XR
lambda vector (Stratagene). The primary library was mass
excised as phagemid using the ExAssist helper phage
(Stratagene), the phagemids were preciticated
with PEG 8000 and extracted with phenol/chloroform.
Phagemid DNA was electroporated into DH10B cells. Clone
Availability: David Sibley, Washington University."

/noce="Vector: palescript SK(+) vector DNA, phagemid excised from lambda ZAP; Site_1: EcoRV; Site_2: EcoRV; Genomic DNA was prepared from asynchronous blood stage forms of the cloned ANA isolate of P. berghei grown in laboratory Swiss white mice. The DNA was purified from contaminating host DNA by Hoechst Dye 33258-CSC1 ultracentrifugation and precipitated. Purified DNA was digested with mung bean nuclease in the presence of 36-38% formamide at 50 C, as described (Vernick, K.D., Imberski, R.B., and McCutchan, T.F. 1988. Nucleic Acids Research 16:6883-6896). The ends of the digestion fragments were polished using T4 DNA polymerase, and the fragments size selected in the range 500-2000 bp. These were ligated into the EcoRV-cleaved and dephosphorylated pBluescript SK(+) vector. Recombinant plasmids were used to transform E. coli XL10-Gold host cells. 1 others

LOCUS BH453173 723 bp DNA linear GSS 12-DEC-2001
DEFINITION BOGKB67TR BOGK Brassica oleracea genomic clone BOGKB67, DNA sequence. Brassica oleracea.

Brassica oleracea.

Bukaryota; Viridiplantae; Streptophyta; Embryophyta; Tracheophyta;

Spermatophyta; Viridiplantae; Streptophyta; core eudicots;

Rosidae; eurosids II; Brassicales; Brassicaceae; Brassica.

Town,C.D., Van Aken,S., Utterback,T. and Fraser,C.M.

Whole genome shotgun sequencing of Brassica oleracea

primer and reverse transcriptase in the presence of 5-methyl dCTP. After second strand synthesis, uneven termini were treated with Pfu DNA Polymerase and Econi adaptors ligated to the blunt ends. The sample was cleaved with XhoI and separated on a Sephacryl S-500 column. Size-fractionated cDNA was precipitated and ligated to HybrizAP arms directionally using EconI-XhoI cleaved arms. After packaging, the phagemid vector (PAD-GAL4) was excised from the HybrizAP vector and plasmid DNA

/note="Vector: pAD-GAL4; At 20-25% parasitemia, blood was collected from BALB/GBVJ mice infected with Py17XL parasites, and leukocytes removed by passage over microcrystalline cellulose collumns. Total RNA was isolated using the quanidinium isothiocyanate method, and mRNA isolated using oligo(dT)-cellulose chromatography.
First strand cDNA synthesis was completed using a 50-base
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               246 TATGGACTTTTTAAAATTTATTAAC...GTTAAAAATAATAAGAAT...A 289

using a method described by Clark and Diamond (Clark, C.G., and Diamond, L.S. (1993) Entamoeba histolytica: a method for isolate identification. Exp. Parasitol. 77:450.). The DNA was mechanically sheared to give a tight size distribution (-2 kb). The v + i method used for the library construction is described in detail in Smith, H.O. and Venter, J.C. (Making small insert libraries for whole genome shotgun sequencing projects. In Genome Sequencing: A Practical Approach, eds. M. Vaudin and B. Barell, Oxford University Press, 1999)."

/note="vector: pBlueScript II (SK-); Site_1: EcoRV; C.
parvum (10WA isolate) genomic DNA was hydrodynamically
sheared to produce fragments having a tight size
distribution between 2-4 kb by Dr. Yronne Thorstenson of
the Stanford DNA Sequencing and Technology Center
(http://sequence-www.stanford.edu/group/techdev/shear.htm
). The randomly sheared gDNA was chromatographed on
Sephacryl S-400 to remove any small fragments and DNA
eluting in the void volume was subcloned into an EcoR
V-digested, alkaline phosphatase-treated pBlueScript II
(SK-) vector and transformed into E. coli strain XL2 Blue
MRF'. Recombinant clones from the first plating of the
library were selected for sequence analysis using T3 and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Eukaryota; Viridiplantae; Streptophyta; Embryophyta; Tracheophyta; Spermatophyta; Magnoliophyta; Liliopsida; Poales; Poaceae; Pooideae

Plants were grown in the greenhouse at the University of
California, Riverside (Fenton, SJ Close, TJ Close). Whole
spikes with awns trimmed were collected at 5, 10, 15, 20,
30 and 45 DAP (Fenton). Total RNA was prepared from each
pool, equal quantities of all six RNA pools were combined,
poly(A) RNA was purified from the mixture, one primary
unamplified cDNA library was made, and 1 million pfu were
in vivo excised to give pBluescript SK(-) cDNA phagemids
(Chol)in the TJ Close lab at the University of California,
Riverside. Phagemids were plated and picked at the Clemson
University Genomics Institute (CUGI) (Begum, Palmer,
Frisch, Atkins and Wing). Plasmid DNA preparations, DNA
sequencing and sequence analysis were performed at CUGI
(Wing, Yu, Frisch, Henry, Simmons, Oates, Rambo, Main).
The sequence has been trimmed to remove vector sequence
and contains a minimum of 100 bases of phred value 20 or
Wing, R., Close, T.J., Kleinhofs, A., Wise, R., Begum, D., Frisch, D., Yu., Y., Henry, D., Palmer, M., Rambo, T., Simmons, J., Choi, D.W., Fenton, R.D., Close, S.J., Oates, R. and Main, D.

Development of a genetically and physically anchored EST resource for barley genomics: Morex 5-45 DAP spike cDNA library Unpublished (2001)

On Jun 26, 2000 this sequence version replaced gi:13187930.

Submitted (12-APR-2000) to the EMBL/GenBank/DDBJ databases
This sequence is a single read and was generated as part of a large
scale clone-end sequencing project of the Tetraodon nigroviridis
genome. For more information, please take a look at

The library was prepared by Michelle Lizotte-Waniewski for Alan
Scott, Johns Hopkins University Medical School, Baltimore.
Sequencing was performed by the Pathogen Sequencing Unit, Sanger
Centre, Cambridge, UK (Neil Hall, Mike Quail & Bart Barrell). The
Sequence contained a PolyA tail (trimmed)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             1. .546

The linary was prepared by Michelle Lizotte-Waniewski for Alan
Scott, Johns Hopkins Oniversity Medical School, Baltimore.
Sequencing was performed by the Pathogen Sequencing Unit, Sanger
Centre, Cambridge, UK (Neil Hall, Mike Quall & Bart Barrell). The
sequence contained a PolyA tail (trimmed)
PCR PRIMERS

botulinum toxin serotypes A-G, is used for inducing an immune response against Novel Botulinum neurotoxin vaccine comprising a fragment from botulinum

Disclosure; Page 39-40; 54pp; English.

The invention relates to novel vaccines that induce a protective immune response against botulinum neurotoxin (BONT) serctypes A. B. C. D. E. F. and G (BONTA-BONTG). The vaccine of the invention is novel recombinant DNA construct comprising a vector, and at least one nucleic acid fragment comprising a Vector, and at least one nucleic acid fragment comprising a C-terminal heavy chain fragment (HC) from BONT serotypes A-G. In preferred embodiments of the invention, the vector is a venezuelan equine encephalitis virus (VEE) replicon vector. Use of this vector results in the production of large amounts of a protein encoded by a sequence cloned into the replicon. The constructs are used to produce vaccines against botulism. The proteins can also be used as diagnostic tools for the diagnosis of botulism. The transformed host cells can be used to analyse the effectiveness of drugs and agents which inhibit toxin effects. The vaccine currently used against botulism is dangerous and expensive to produce, and contains formalin, which is very painful for the recipient. Also, the vaccine is incomplete, in that only so the 7 serotypes are represented in the formulation. The novel vaccine of overcomes these problems, as it is easily purified, and available in large quantities. It is also expressed in the lymph nodes for a better immune response. Botulism neurotoxins are translated as a single 150 kDa polypeptide chain and then posttranslationally nicked, forming a dichain which consisting of a 100 kDa heavy chain and a 50 kDa light chain which remain linked by a disulfide bond. Nucleic acids encoding the carboxy-terminal (HC) or amino-terminal (HN) portion of the heavy carboxy-terminal (HC) or amino-terminal (HN) portion of the heavy carboxy-terminal (HC) or amino-terminal (HN) portion of the heavy carboxy-terminal (HC) or amino-terminal (HN) portion of the heavy carboxy-terminal (HC) or amino-terminal (HN) portion of the heavy carboxy-terminal (HC) or amino-terminal (HN) portion of the heavy carboxy-terminal (HC) or amino-terminal (HN) portion of the heavy carboxy-terminal (HC) or amino-terminal (HN) portion of the heavy carboxy-terminal (HC) or amino-terminal (HN) portion of the nucleic acids are expressible in a recombinant collect acids are advantageous since it eliminates the need to culture large quantities of hazardous toxin-producting bacterium. Production yield from the genetically engineered product is also high and cost of production is lower. The nucleic acids can

Botulism neurotoxins are translated as a single 150 kDa polypeptide chain and then posttranslationally nicked, forming a dichain which consisting of a 100 kDa heavy chain and a 50 kDa light chain which remain linked by a disulfide bond. Nucleic acids encoding the camboxy-terminal (HC) or amino-terminal (HN) portion of the heavy chain of botulinum neurotoxin (BoNT) can be used in recombinant expression vectors and expressed in transformed cells to produce protective immunity against botulinum neurotoxin, which causes botulism. The nucleic acids are expressible in a recombinant of recombinant nucleic acids are advantageous since it eliminates the need to culture large quantities of hazardous toxin-producing the need to culture large quantities of hazardous toxin-producing the pacterial of the need to culture large quantities of hazardous toxin-producing the pacterial of the need to culture large quantities of hazardous toxin-producing the pacterial of the need to culture large quantities of hazardous toxin-producing the pacterial of the need to culture large quantities of hazardous toxin-producing the pacterial of the need to culture large quantities of hazardous toxin-producing the genetical production are not to the need to culture large quantities of hazardous toxin-producing the genetical production are need to continue production and the genetical production are need to continue production and the genetical production are need to continue production and the genetical production are need to continue production and the genetical production are need to continue production and the genetical production are need to continue production and the genetical production are need to continue production and the genetical production are need to continue production and the genetical production are need to continue production and the need to continue production are need to continue production and the need to continue production are need to continue production and the need to continue production are need to continue production

                                                                                                                                                             This is the DNA sequence of the Clostridium botulinum serotype B (Danish strain) toxin fragment C gene contained in plasmid pETHisb. The encoded fragment C polypeptide (see AAM68394) has a His-tagged N-terminal extension. The vector was used to express native (i.e. non-fusion) soluble C fragment in Escherichia coli host cells. The invention relates to recombinant proteins derived from C. botulinum toxins. Methods are provided which allow for the isolation of soluble recombinant proteins free of significant endotoxin contamination. Preferred hosts for production of

                                                                                                                                                                                                                                  This is the coding region of the Clostridium botulinum serotype B (Danish strain) toxin gene that codes for a 1291-amino acid polypeptide (see AAW68329.) The C fragment (see AAW68394) of the b toxin has been expressed as histidine-tagged protein in Escherichia coli host cells. The invention relates to C. botulinum recombinant

toxin polypeptides. Methods are provided which allow for the isolation of soluble recombinant proteins free of significant endotoxin contamination. Preferred hosts for production of the recombinant proteins are E. coli, insect cells and yeast cells. The recombinant proteins are used as immunogens for the production of vaccines and antitoxins that are useful in the treatment of humans and animals at risk of intoxication with clostridial toxin.

This is the DNA sequence of the Clostridium botulinum serotype B toxin fragment C gene contained in plasmid phisbotb. The encoded fragment C polypeptide (see AAW66393) has a histidine-tagged ragment c polypeptide (see AAW66393) has a histidine-tagged N-terminal extension. The vector was used to express native (i.e. non-fusion) soluble C fragment in Escherichia coli host cells. The invention relates to recombinant proteins derived from C. botulinum toxins. Methods are provided which allow for the isolation of soluble recombinant proteins free of significant endotoxin contamination. Preferred hosts for production of recombinant toxins are E. coli, insect cells and yeast cells. The recombinant toxins are used as immunogens for the production of vaccines and antitoxins that are useful in the treatment of humans and animals at risk of intoxication with clostridial toxin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       489

plasma membrane associated proteins essential to exocytosis, and where plasma membrane associated proteins essential to exocytosis, and where the second domain is adapted: (a) to translocate the protein into a cell; (b) to increase the solubility of the protein compared to the solubility of the first domain on its own, or (c) both to translocate the protein into a cell and to increase the solubility of the protein compared to the solubility of the first domain on its own, the protein being free of clostridial neurotoxin (CN) and free of CN precursor that proteins can be used as therapeutic agents for targeting cells protein a substrate. The products can also be used as immunogens and as non-toxic standards for the assessment and development of in vitro assays for the detection of functional botulinum or tetanus neurotoxins either in foodstuffs or in environmental samples.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    2733

Botulism neurotoxins are translated as a single 150 kDa polypeptide chain and then posttranslationally nicked, forming a dichain consisting of a 100 kDa heavy chain and a 50 kDa light chain which remain linked by a disulfide bond. Nucleic acids encoding the remain linked by a disulfide bond. Nucleic acids encoding the carboxy-terminal (HC) or amino-terminal (HN) portion of the heavy chain of botulinum neurotoxin (BOWT) can be used in recombinant expression vectors and expressed in transformed calls to produce peptide antigens useful for eliciting an immune response to give protective immunity against botulinum neurotoxin, which causes botulism. The nucleic acids are expressible in a recombinant corganisms such as Escherichia coli or Pichia pastoris. The use of recombinant nucleic acids are advantageous since it eliminates the need to culture large quantities of hazardous toxin producing the patentically engineered production is a patentically engineered production to the patentically engineered production to the need to culture large quantities of hazardous toxin producting the generically engineered production to the patentically engineered production and production the generically engineered production and producti

The invention relates to novel vaccines that induce a protective immune response against botulinum neurotoxin (BoNT) serotypes A, B, C, D, E, F and G (BoNTA-BoNTG). The vaccine of the invention is novel recombinant DNA construct comprising a vector, and at least one nucleic acid fragment comprising a vector, and at least one nucleic acid fragment comprising a vector, and at least one nucleic acid fragment comprising a c-terminal heavy chain fragment (HC) from BoNT serotypes A-G. In preferred embodiments of the invention, the vector is a venezuelan encephalitis virus (VEE) replicon vector. Use of this vector results in the production of large amounts of a protein encoded by a sequence cloned into the replicon. The constructs are used to produce vaccines against botulism. The proteins can also be used as diagnostic tools for the diagnosis of botulism. The transformed host cells can be used to analyse the effectiveness of drugs and agents which inhibit toxin effects. The vaccine currently used against botulism is cangenous and expensive to produce, and contains formalin, which is very painful for the recipient. Also, the vaccine is incomplete, in that only 5 of the 7 serotypes are repersented in the formulation. The novel available in large quantities. It is also expressed in the lymph nodes contains the better immune response. Sequences AARST21 represent
/product= "Synthetic botulinum neurotoxin serotype G (BONTC) heavy chain C-terminal fragment (Hc)" /note= "No stop codon given in the specification"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           NNA sequences encoding BoNT Hc fragments used in the present
These were optimised for codon usage for expression in yeast.
                                                                                                                                                                                                                                                                                                                                                                                                          Novel Botulinum neurotoxin vaccine comprising a fragment from botulinum toxin serotypes A \cdot G_{\nu} is used for inducing an immune response against
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        238

Botulism neurotoxins are translated as a single 150 kDa polypeptide chain and then posttranslationally nicked, forming a dichain consisting of a 100 kDa heavy chain and a 50 kDa light chain which remain linked by a disulfide bond. Nucleic acids encoding the carboxy-terminal (HC) or amino-terminal (HN) portion of the heavy chain of botulinum neurotoxin (BoVT) can be used in recombinant expression vectors and expressed in transformed cells to produce peptide antigens useful for eliciting an immune response to give protective immunity against botulinum neurotoxin, which causes botulism. The nucleic acids are expressible in a recombinant organisms such as Escherichia coli or Pichia pastoris. The use of recombinant nucleic acids are advantageous since it eliminates
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               the need to culture large quantities of hazardous toxin-producing bacterium. Production yield from the genetically engineered product is also high and cost of production is lower. The nucleic acids can be derived from clostridium botulinum serotypes A-G.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New nucleic acids encoding the carboxy- or amino-terminal portions the heavy chain of botulinum neurotoxin of serotype A-G, useful as vaccine against botulism
                                                                                                                                                                                                                           Botulism toxin heavy chain C-terminal coding sequence (serotype A)
                                                                                                                                                                                                                                                                                     oxin; neurotoxin; heavy chain; recombinant expression; vector; antigen; immune response; vaccine; bacterium;

Botulism neurotoxins are translated as a single 150 kDa polypeptide chain and then posttranslationally nicked, forming a dichain consisting of a 100 kDa heavy chain and a 50 kDa light chain which remain linked by a disulfide bond. Nucleic acids encoding the carboxy-terminal (HC) or amino-terminal (HN) portion of the heavy chain of botulinum neurotoxin (BoNT) can be used in recombinant expression vectors and expressed in transformed cells to produce peptide antigens useful for eliciting an immune response to give protective immunity against botulinum neurotoxin, which causes botulism. The nucleic acids are expressible in a recombinant corganisms such as Escherichia coll or Pichia pastoris. The use of recombinant nucleic acids are advantageous since it eliminates the need to culture large quantities of hazardous toxin-producing bacterium. Production yield from the genetically engineered product

```

```
A synthetic gene (AAT29245) codes for the heavy chain C fragment (ARA89608) of Clostridium botulinum type A neurotoxin (see also AAR95010). Codon usage allowing efficient gene expression in Escherichia coli was utilised. The gene in vector palterBot was used to make expression constructs in which fragments of C difficile toxin A repeat domains were expressed as genetic fusions with the C. botulin C fragment and expressed in E. coli.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This is the DNA sequence of the Clostridium botulinum serctype A toxin C-fragment gene contained in plasmid pAlterBot. Recombinant C-fragment proteins have been produced in Escherichia coli as fusion proteins with either maltose binding protein or clostridium difficile type A toxin (see AAW68387). The invention relates to recombinant proteins derived from C. botulinum toxins. Methods are provided which allow for the isolation of soluble recombinant proteins free of significant endotoxin contamination. Preferred hosts for production of recombinant proteins are E. colinesed as immunogens for the production of vaccines and antitoxins that are useful in the treatment of humans and animals at risk of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Botulism neurotoxins are translated as a single 150 kDa polypeptide chain and then posttranslationally nicked, forming a dichain consisting of a 100 kDa heavy chain and a 50 kDa light chain which remain linked by a disulfide bond. Nucleic acids encoding the carboxy-terminal (HC) or amino-terminal (HN) portion of the heavy chain of botulinum neurotoxin (BONT) can be used in recombinant expression vectors and expressed in transformed cells to produce peptide antigens useful for eliciting an immune response to give protective immunity against botulium neurotoxin, which causes botulism. The nucleic acids are expressible in a recombinant organisms such as Escherichia coli or Pichia pastoris. The use
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   portions useful as

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              recombinant nucleic acids are advantageous since it eliminates e need to culture large quantities of hazardous toxin-producing cterium. Production yield from the genetically engineered productably high and cost of production is lower. The nucleic acids ca derived from Clostridium botulinum serotypes A-G.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           tategaagaaeggtacaagatecagtettaeteegaataeetgaaagaettetgggggtaa

"Synthetic botulinum neurotoxin serotype A (BoNTA) heavy chain C-terminal fragment (HC)"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Novel Botulinum neurotoxin vaccine comprising a fragment from botulinum toxin serotypes A \cdot G_i is used for inducing an immune response against
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to novel vaccines that induce a protective immune response against botulinum neurotoxin (BONT) serotypes A, B, C, D, E, F and G (BONTA-BONTG). The vaccine of the invention is novel recombinant DNA construct comprising a vector, and at least one nucleic acid fragment comprising a c-terminal heavy chain fragment (Hc) from BONT serotypes A-G. In preferred embodiments of the invention, the vector is a Venezuelan equine encephalitis virus (VEE) replicon vector. Use of
